2Department of Neurology, Fann National Teaching Hospital, Senegal

Abstract

**Background:** In Niger, palliative care is a necessity in everyday medical practice. However, the setting up of structures and / or mobile teams specifically dedicated to palliative medicine still faces enormous challenges.

**Methods:** This work is an update on the status of research, teaching and services relating of palliative medicine in Sakoira Integrated Health Center (SIHC) in Niger and literature review.

**Results:** Most patients who consult for non-communicable disease or specifically for tumors or other incurable illnesses come advanced stages, requiring palliative care whereas there is as yet no national structure specifically dedicated to palliative care. No domain of research in palliative care is developed in Niger. No specific scientific work on palliative care have been conducted and published in Niger. This testifies to the lack of promotion of this specialty in Niger.

**Conclusion:** The ignorance of palliative care, access to morphine and ordinary molecules fight against pain are a real obstacle to the practice of palliative medicine in Sakoira Integrated Health Center (Tillabéri) in republic of Niger.

SIHC: Sakoira Integrated Health Center; WHO: World Health Organization

**BACKGROUND**

In sub-Saharan Africa, Niger is developing country with a population about 17,807,117 million on an area of 1,276,000 km² [1], two-thirds are located in area Saharan [2]. It is located between parallels 11° 37 and 23° 33 of North latitude one hand, and meridians 16° East and 1° 0' of the other West longitude. It’s a steppe country, limited to the West by Burkina Faso, to the east by Chad, north by Algeria and Libya, on the south by Benin and Nigeria, and to the northwest by Mali. The geographical situation of Niger made the country a hub for trade between Africa North and Africa south of the Sahara [2]. Sakoira is a rural community of Tillabéri department. It is located 122 km from Niamey (capital of Niger). Its population was estimated at 27,076 inhabitants, 13,001 men 14,075 women. It is a common composed of 6 villages and 5 tribes. Its area is 173 km² with 1 following geographical coordinates 14° 16'60" north and 1° 24'0" 'East (Monograph of the municipality of Sakoira).

The national policy of the Niger health based on Primary Health Care at through the development of health districts. This is taken to adapt the consequences of financial crises and to take into account the commitments International which Niger has subscribed, including those related to the achievement the Millennium Development Goals (MDGs) and those of the Plan of Economic and Social Development (PDES 2012-2015) [2]. But in Niger, palliative care is again a necessity in everyday medical practice. However, the setting up of structures and / or mobile teams specifically dedicated to palliative medicine still faces enormous challenges that we raised here.

**METHODS**

This work is an update on the status of research, teaching and services relating of palliative medicine in SIHC (Figure 1) in Niger. That through the experience at the national level in general and in particular Sakoira with literature review.

**RESULTS**

In republic of Niger (West Africa), most patients who consult for non-communicable disease or specifically for tumors or other incurable illnesses come advanced stages, requiring palliative care whereas there is as yet no national structure specifically dedicated to palliative care. In contrast, about some ten health
According to WHO, it is becoming a public health problem in 2009, 7031 cases of cancer were recorded in Niger region. Sixty-four percent of new cancer cases worldwide are registered in the continent are incurable at the time of detection and diagnosis [5]. Cancer in sub-Saharan Africa in 2008. However, poor access to health services and few cancer registries on the continent make this a probable underestimate. Because availability of health services is low and access is poor, about 80% of cancers on the continent are incurable at the time of detection and diagnosis [5,7]. Until 2009, 7031 cases of cancer were recorded in Niger [8]. According to WHO, it is becoming a public health problem in developing countries by increasing its frequency [9].

Palliative care involves the physical, emotional, practical, and spiritual aspects of the patient’s suffering in the course of the illness [3]. Palliative care, end of life care, care of the dying, is a specialty. Yet their practice crosses all disciplines of cardiology to oncology, neurology to geriatrics. They relate to all ages, from pediatrics to geriatrics services [4]. According to the regional office for the WHO African (Afro), non communicable diseases (atherosclerosis, diabetes, cancer and other chronic diseases) should represent half of 2030 deaths against a quarter in 2004. The free care is not yet in many African countries. In most African countries, programs of prevention and fight against cancer are lacking or have shortcomings. Certainly caregivers will face many problems, but their determination must be stronger to cope. It takes a lot communication to help those in great suffering patients [12]. This determination requires practitioner’s awareness. This is possible only through a training of all caregivers in palliative care. We must therefore provide care training Palliative health staff in hospitals and the community, teachers and community leaders; they can in turn pass on their knowledge to community health workers, volunteers and families [12].

In 2013, four physicians have been trained in palliative care at Hospice Africa Uganda, through theoretical and practical training in teaching hospitals in Kampala and other regional hospices (Uganda). That is why palliative care is a real need in African countries in general and Niger in particular. Also, the health policy particularly to the search for equity, improving quality of care and accessibility to a larger number of vulnerable people (women, children, disabled people, people in rural areas) to health services. However, the implementation of this policy has not been effective and consequently has not had the expected impact on key health indicators, namely the strong maternal and child mortality and the high mortality associated with prone diseases epidemic. This is mainly due to: inadequacies in the choice of strategies, the low attention given to financial protection for users and health inequalities between rural and urban areas the system’s weakness monitoring and evaluation and governance.

The majority of these chronic diseases share common incurable pain. The pain affects approximately 60% of patients with cancer. It is sufficiently taken into account, especially in developing countries. It greatly affects the quality of life of patients and requires adequate care can include, where necessary, morphine [10]. However, morphine is expensive for patients victims of incurable diseases. But in Niger, as in other West African countries, the low level of income does not allow the majority of patients to obtain morphine.

Yet, Africa French speaking countries was November 2008; the host of the department Material World Forum on Research for HEALTH at Bamako, the international momentum is conducive to debates on free HEALTH CARE [11]. The contemporary debate in the field of financing of HEALTH is the suppression of direct payment [11].

The free care is not yet in many African countries. In most African countries, programs of prevention and fight against cancer are lacking or have shortcomings. Certainly caregivers will face many problems, but their determination must be stronger to cope. It takes a lot communication to help those in great suffering patients [12]. This determination requires practitioner’s awareness. This is possible only through a training of all caregivers in palliative care. We must therefore provide care training Palliative health staff in hospitals and the community, teachers and community leaders; they can in turn pass on their knowledge to community health workers, volunteers and families [12].

More Hematologic malignancies are serious diseases that affect many people worldwide. They mark the entry into a heavy and long-care process. The African continent is not spared. The fight against this scourge in Africa is underpinned many challenges, despite the lack of inadequacy of material and financial resources, and lack of qualified staff [12]. Including palliative care is a real need in African countries in general and Niger in particular. Also, the health policy particularly to the search for equity, improving quality of care and accessibility to a larger number of vulnerable people (women, children, disabled people, people in rural areas) to health services. However, the implementation of this policy has not been effective and consequently has not had the expected impact on key health indicators, namely the strong maternal and child mortality and the high mortality associated with prone diseases epidemic. This is mainly due to: inadequacies in the choice of strategies, the low attention given to financial protection for users and health inequalities between rural and urban areas the system’s weakness monitoring and evaluation and governance.

In 2013, four physicians have been trained in palliative care at Hospice Africa Uganda, through theoretical and practical training in teaching hospitals in Kampala and other regional hospices Uganda [13]. Forty-health workers were trained in palliative care at national level. To facilitate communication between patient and health workers use a booklet that lists questions that can be asked the doctor by the patient during a consultation supportive care and palliative care showed his interest in facilitating communication [14,15]. This linguistic difficulty of access to English also big handicap caregivers African French speaking countries because most people do not have access to documents.
written in English. While palliative care is not developed in these African French speaking countries compared to English-speaking African countries such as Uganda, for example.

A booklet listing of issues correlation with different areas of concern has been designed and approved by the Medical Psychology Research Unit (MPRU) University Sydney, Australia [16]. This booklet was adapted in French to respond to these communication needs between patients and health workers [17].

**CONCLUSION**

For Palliative Care in Niger and Africa in general, our public health political electoral must consider the need for investment in the field of palliative medicine to help people in later life or chronically ill. And the grant of morphine is one of the major challenges faced in this problem. Palliative medicine is widely practiced in Niger. There is the need for a reorientation of public health policy on palliative care for a better grip on holistic chronic disease increasingly emerging in Africa in general and in Niger in particular.
